Something in the air?

Debris accumulating in air ducts can propagate allergens, mould and provide a breeding/feeding ground for insects and even vermin. This can impair staff productivity and pose serious health risks according to **Indepth Hygiene Services**.

Poor air quality can affect employee performance due to lack of concentration and low energy levels and can lead to an increase in sick days.

Under The Workplace (Health, Safety & Welfare) Regulations, building owners and managers have a legal obligation to ensure that enclosed workplaces are ventilated with fresh, purified air. Keeping ducting in the workplace clean and properly maintained is therefore good for health - and good for business too.
