

Should your Ventilation System carry a HEALTH WARNING?

Dust and debris accumulated on internal surfaces of general ductwork system (air conditioning)

Let Indepth Hygiene Services, the UK's leading ductwork monitoring and cleaning specialist, provide a review of your air supply systems – **FREE OF CHARGE**

The essential function of a ventilation system is to circulate clean safe air, especially where they serve facilities requiring the highest standards of air cleanliness, but if not professionally and regularly cleaned throughout their entire length they provide ideal conditions for the cultivation and dissemination of HAs, becoming an **infection hotspot**.

Building Managers have a duty of care and legal requirement to maintain ventilation systems so they do not present a potential threat to the health of patients, staff and visitors. Only regular, specialist monitoring and cleaning in compliance with HTM03-01 standard (specialised ventilation for healthcare premises), will achieve recommended bacterial content and cleanliness levels.

Indepth Hygiene provide a specialist one stop service tailored to the Healthcare sector's specific requirements with managed provision to minimise disruption:

- Debris thickness, humidity level testing and air quality monitoring.
- Comprehensive review and assessment/survey report of any health risk inc. photographs and detailed system schematics.
- Potential transmission routes identified and appropriate action recommended.
- Test, monitor, clean, supply and fit air filters (high efficiency HEPA filters play an essential role in combating spread of infection).
- Ventilation cleaning in compliance with legislation and in accordance with B&ES (HVCA) TR19 and HTM 03-01.
- Provision of insurance industry approved certification upon service completion.

**For an initial visit and survey of your ventilation systems,
entirely FREE OF CHARGE**
